

The revo phone system from Revolution Phones Limited is a Hosted VoIP package.

This means that all calls travel over Internet connections rather than traditional analogue or ISDN phone lines.

More importantly, the routing of internal, external and extension-to-extension calls is carried out at our central Network Core instead of at a privately owned PABX switch at the customer's premises.

This makes the Revo system very flexible:

- No need to buy future capacity to allow for growth – phones can be added on demand (even one at a time)
- New facilities can be added as required without the need for further capital expenditure e.g. voicemail, music-on-hold or call recording etc can be switched on at will, there is no more hardware to be purchased
- Short-term expansion is easy and inexpensive. It would be possible, for example, to set up a temporary telesales office for a one-off campaign, then close it down again a month later
- Organisations can open new branches at different locations and all the phones will be integrated into a single organisation-wide system
